Example 3 - Patch it like it's Hot 🔥

- Here's where `get_next_meetup()` is actually used

```python
def handle_intent(intent):
    """
    Right now we'll just handle all intents as a request for the next meeting
    :return: message String
    """

    if intent == NEXT_EVENT_INTENT:
        msg = 'The next Burlington Python meetup is "{title}" on {date} at {venue}'
        meetup = get_next_meetup('btvpython')
        if meetup:
            return msg.format(**meetup)
        else:
            return 'Sorry, I could not find an upcoming event for Burlington Python.'
```

Example 3 - Patch it like it's Hot 🔥

- **Double the patches, double the fun!**

```python
@patch('sys.stdout', new_callable=six.StringIO)
@patch('seal_rookery.convert_images.convert_images')
def test_failure_in_convert_images_returns_non_zero(self, mock_convert, mock_stdout):
    """
    Test that any failure in the conversion routine will result in a
    non-zero return code from the interpreter.
    """

    return_code = convert_images.main(argv=[])
    self.assertEqual(1, return_code)
    self.assertTrue('Failed to update seals!' in mock_stdout.getvalue())
```
