Example 3 - Patch it like it's Hot 🔥

- **Super simple example:** *patch a function with a stub*

```python
@patch('btvpython.alexa.get_next_meetup', return_value={})
def test_no_meeting_response(mock):
    response = alexa.handle_intent(alexa.NEXT_EVENT_INTENT)
    assert 'Sorry, I could not find an upcoming event' in response
```

- **NOTE:** *Always patch the object/call WHERE IT IS USED!*

Example 3 - Patch it like it's Hot 🔥

- Here's where `get_next_meetup()` is actually used

```python
def handle_intent(intent):
    """
    Right now we'll just handle all intents as a request for the next meeting
    :return: message String
    """

    if intent == NEXT_EVENT_INTENT:
        msg = 'The next Burlington Python meetup is "{title}" on {date} at {venue}'
        meetup = get_next_meetup('btvpython')
        if meetup:
            return msg.format(**meetup)
        else:
            return 'Sorry, I could not find an upcoming event for Burlington Python.'
```
